

LIFECYCLE

FDE PROTOTYPING TASK LIST (PHASE 1)

Phase	Detailed Tasks	Human / Agent (Claude)	Deliverables & Outcomes
Intake Process	• Prepare feature documentation and business requirements • Perform technical feasibility assessment • Complete tech inventory review • Procure development environment • Claude Code project setup • PortKey LLM gateway configuration • GitHub repository structure	90/10	• Feature Docs • Feasibility Report <i>Signed-off feature specification, feasibility check, and provisioned dev environment with Claude Code + PortKey ready for agent development.</i>
Setup the Infrastructure	• Set up the required cloud services • Provision Azure cloud services (Reference) ▪ Key Vault — secrets & entitlements ▪ AI Search (vector-enabled index) ▪ Cosmos DB — agent state & memory ▪ Container Apps — service hosting ▪ Application Insights + Log Analytics • Set up databases: Postgres / MongoDB / SQLite/CromaDB • Configure orchestration layer: N8N + LangGraph • Establish entitlements, secrets, and user profiles • Create Claude Code project skeleton • Identify and configure MCP servers for AI agents • Provision test frameworks and CI scaffolding	90/10	• Technical Inventory • Project Skeleton Base <i>Verified Azure environment, orchestration layer live, MCP servers identified and configured, project skeleton ready for feature development.</i>
Data Prep	• Generate or ingest seed data (synthetic + reference datasets) • Build seed data ingestion pipeline (RAG-enabled) • Validate retrieval quality — index completeness, relevance thresholds • Enable audit trail schema in target database • Build golden dataset: curated test scenarios covering • Adversarial prompt inputs • PII redaction scenarios • Citation retrieval edge cases	60/40	• DB enabled for RAG retrieval • Golden Dataset <i>RAG-enabled database ready for retrieval. Golden test dataset validated. Audit trail schema provisioned and accepting events.</i>

QUICK FDE PROTOTYPING (PHASE 2)

Phase	Detailed Tasks	Human / Agent (Claude)	Deliverables & Outcomes
Solutioning	- Define reference technical architecture - Author Architecture Decision Records (ADRs) and guidelines in Claude Code - Map API integration points and data contracts - Define data model and schemas - Design UX interface: dashboard layout, chat interface - Prompt format and response style - Agent response structure and citations display	70/30	- Reference Architecture diagram / Flow - ADR Files <i>Reference architecture diagram, ADR set, API contract map, and approved data model. UX wireframe signed off.</i>
RAG Pipeline & Orchestration Layer	- Configure API-based RAG pipeline - Apply PII redaction guidelines at retrieval boundary - Connect retrieval to PortKey LLM gateway with citation passthrough - Format LLM responses for UI consumption (citations + chunk references + Doc ID) - Develop and validate test scenarios for - Chunking and retrieval strategy - Citation format (chunk + primary key) - PII redaction coverage (compliance standards)	40/60	- Tested RAG pipeline. - Citation Format <i>End-to-end RAG pipeline with PII redaction live. Citations formatted and rendered. Retrieval strategy documented.</i> SR1
Backend (.NET) Development	- Scaffold .NET project and API layer - Implement MCP server endpoints for AI agent tool use - Build Audit Trail APIs: event ingestion, schema validation, query interface - Develop agent action APIs (agent-initiated writes/sends via HITL gate)	40/60	- Backend code - Tested APIs <i>NET project with MCP server, Audit Trail API, and HITL action endpoints. All APIs tested and documented.</i>
Front End – React	- Build lightweight dashboard (agent status, activity feed) - Develop chat interface with citation rendering - Implement HITL review UI; agent-proposed action display, approve/reject/modify controls	40/60	React UI <i>Functional dashboard and chat UI with citations. HITL approval workflow rendered and wired to backend action APIs.</i>
Integration; Evaluation & Deployment	- End-to-end integration: React UI → .NET API → RAG pipeline → Audit Trail → HITL - Functional and feature testing across all agent capabilities - Adversarial and security testing ; prompt injection, boundary cases - Evaluation framework: Faithfulness, Accuracy, Groundedness, PII Compliance - Verify audit trail completeness and observability coverage - User documentation and demo packaging - Align with client deployment cycle for production release	50/50	- E2E Tested App - Evals Reports - Deployment Ready <i>Fully integrated, evaluated, and deployed prototype. Evaluation scorecard, demo package, and deployment ready</i>

Slide 4

SR1

Side Notes:

Add the chunking and retrieval strategy (agnostic)

Citations format (chunks + any primary keys)

PII Dedaction List(Any compliance standards to be imported)
